

Feature Analysis: PDF Profile Download Improvements

Product Area: Admin + Seasoned Professional — Profile Downloads

Sprint: May 2026

Release Date: May 5, 2026

Analysis Period: November 10, 2025 – May 23, 2026

Role: Product Intern, WisdomCircle

1. Scorecard

Expected Impact	Success Criteria	Result	Recommendation
Improved candidate PDF quality for hiring managers; admin team flexibility across download types	Post-launch adoption across all three download options; PDF quality issues eliminated	Profile downloads growing month-on-month (2→59 users); Without Name limited to 15 users; Answers at 0 post-launch sessions	Monitor

2. What Was Built

A PDF quality overhaul for candidate profile downloads - fixing pixelation on zoom, enabling text selection, and reducing file size from ~5–7MB to under 500KB. Two new download options were added to the admin 3-dot menu: *Download without Name* for anonymised candidate sharing, and *Download only Answers* for sharing screening responses without the full profile. The PDF template was also updated with a WisdomCircle AI summary box, refreshed branding, and a Work Authorization section.

3. Why We Built It

The business team was sharing candidate PDFs with hiring managers that pixelated on zoom, had non-copyable text, and were too large to attach to emails. Beyond the quality issue, the admin team had no flexibility - sharing an anonymised profile or a candidate's screening answers alone required manual workarounds. Both problems directly affect hiring manager experience, which matters particularly during an active international expansion phase.

4. What the Data Shows

Note: Download-specific session and event counts are taken from Fullstory segment-level totals. Monthly unique user counts are derived from Fullstory CSV exports and reflect each user's last session within the segment - used here as a proxy for recency of usage.

Metric 1: Download Profile - Seasoned Professionals

Source: Fullstory - "Download Profile" click segment, Nov 10, 2025 – May 23, 2026

Metric	Value
Unique users	133 of 128,727 (<1%)
Total sessions	549
Total events	1,118
Seasoned professionals	101 of 133 (75.9%)
Admin / internal users in segment	32 of 133 (24.1%)
Desktop users (professionals only)	59 of 101 (58.4%)
Mobile users (professionals only)	42 of 101 (41.6%)
Post-launch isolated data	Not extractable - segment covers full Nov–May window

Tracking gap: Admin and professional clicks fire the same event - admin-specific usage for *Download Profile* cannot be isolated from this segment.

Monthly unique users - Download Profile

Period	Unique Users	Notes
Nov 2025	2	Earliest activity
Dec 2025	11	
Jan 2026	6	Drop from December
Feb 2026	11	Recovery
Mar 2026	15	
Apr 2026	29	Notable uptick
May 2026	59	Highest month - feature launch

Metric 2: Download without Name - Admin

Source: Fullstory - "Download without Name" click segment, Nov 10, 2025 – May 23, 2026

Metric	Value
Unique users	15 of 128,727 (<1%)
Total sessions	41
Total events	132
User type	Internal admin team only
External or professional users	0 - access restriction confirmed correct
Users last active in May 2026	13 of 15 (86.7%)
Overlap with Download Profile segment	100% - all 15 users also clicked Download Profile

Monthly unique users - Download without Name

Period	Unique Users	Notes
Feb 2026	1	First recorded usage
Mar 2026	0	No activity
Apr 2026	1	
May 2026	13	Sharp spike around launch

Metric 3: Download only Answers - Admin (new feature)

Source: Fullstory - "Download only Answers" click segment, Nov 10, 2025 – May 23, 2026

Metric	Value
Unique users	6 of 128,726 (<1%)
Total sessions	6
Total events	6
User type	Internal admin team only
Repeat usage across any user	0 - each user clicked exactly once
Device	Desktop: 6 (100%)
Most recent matching session	April 3, 2026
Post-May 5 confirmed production sessions	0
Overlap with Download Profile segment	100%
Overlap with Download without Name segment	5 of 6 users

Note: Monthly breakdown is not meaningful for this segment - all 6 users' last overall platform sessions fall in May 2026 regardless of when their download clicks occurred (December 2025 – April 2026 based on Fullstory session recordings).

Metric 4: Device Split - Download Profile (Professionals)

Source: Fullstory CSV export

Device	Users	%
Desktop	59	58.4%
Mobile	42	41.6%

OS	Users
Windows	53
Android	33
OS X	9
iOS	6

Mobile accounts for 41.6% of professional download sessions - the improved PDF must render and function correctly on both Android and iOS.

5. Expectation vs. Reality

The feature was built to fix a quality problem and give the admin team more flexibility. The quality fix - the core rationale - is entirely unmeasured by click tracking. There is no signal available to confirm whether hiring managers are receiving better PDFs or whether the improvements have changed their perception of candidates.

On adoption, the picture is mixed. *Download Profile* shows consistent month-on-month growth from 2 users in November to 59 in May, which is the strongest positive signal in this analysis. However, the data covers the full six-month window without a pre/post filter, making it impossible to attribute the May uptick specifically to the launch rather than to general platform growth. *Download without Name* shows a sharp spike to 13 users in May from near-zero in prior months - too early to confirm whether this is sustained workflow adoption or a one-time effect of launch awareness. *Download only Answers* is the clearest gap: 0 post-launch production sessions, with all 6 recorded clicks being pre-launch internal testing. The feature went live and was not picked up, though whether this reflects low need or low discoverability has not yet been determined.

6. Qualitative Signals

The five-user core group is carrying all admin download behaviour. The same five users appear across all three segments - *Download Profile*, *Download without Name*, and *Download only Answers*. Admin download activity is concentrated in a small group of heavy internal users. If their workflows shift, all three metrics decline simultaneously.

Mobile usage among professionals is higher than expected. 41.6% of *Download Profile* sessions from seasoned professionals occur on mobile. Given the nature of the quality improvements - particularly PDF rendering and text selection - it is worth verifying the updated PDF functions correctly on Android and iOS before treating mobile usage as a positive signal.

Active users have not returned to Download only Answers post-launch. All 6 users who tested *Download only Answers* before launch are currently active on the platform in May 2026. Their non-use post-launch is not explained by inactivity - it points either to low workflow need or to the option not being surfaced clearly enough in the Applications page menu.

PDF quality improvements have no measurement attached to them. Clicks confirm the download action is happening, but nothing in the current tracking setup can confirm whether the improved PDF is reaching hiring managers without pixelation or size issues. Downstream quality impact remains unverified.

7. Recommendation

Monitor - *Download Profile* is growing month-on-month and the May spike is worth tracking through June to confirm whether it sustains. Pull a post-May 5 filtered segment to establish a clean post-launch baseline; if month-on-month growth does not continue by June 30, investigate whether the improved PDF is clearly surfaced in the professional profile view. Additionally verify the PDF renders correctly on mobile given 41.6% of professional download sessions occur on mobile.

Monitor - *Download without Name* has 15 active users with a May spike that may reflect launch awareness; give it until June 15 to confirm whether it sustains into a regular workflow pattern. If unique users remain under 20 after that, review whether the option is clearly labelled and positioned in the 3-dot menu.

Monitor - *Download only Answers* has 0 post-launch sessions, but this may reflect low workflow needs rather than a discoverability problem. Before making any changes, confirm with the admin team whether downloading answers separately is part of their regular workflow. If they confirm it is not something they need frequently, this is expected behaviour and the feature can sit as-is. Revisit in 6 weeks - if usage remains at 0 and the team confirms awareness but no use case, no further action is needed.

Structural gap across all three options - wire a backend event for all three download types. Without it, post-launch trends and downstream outcomes - whether PDF downloads correlate with application activity or hiring outcomes - remain unmeasurable in every future sprint review.
