Academic Voice Mode

A structured voice drafting layer that helps Indian students speak complex academic doubts to ChatGPT.

TEAM	STATUS	LAUNCHING ON	BUILDS ON
Apratim Saxena	In development	ChatGPT mobile, India, student segment	Milestone 01, Milestone 02

PROBLEM

Indian college students (18–24) are the largest ChatGPT mobile segment, about 48%. They are comfortable with voice in other apps, yet they do not use voice in ChatGPT regularly.

They struggle to structure complex questions while speaking, feel rushed, and cannot edit a thought mid-flow. ChatGPT voice is built for conversation, but academic use is about drafting and structuring.

Solving this closes the adoption gap and raises engagement in the highest-frequency segment.

GOALS

1	**More students use voice every week**	Share of student daily users who start at least one voice query in a week
2	**More voice queries get finished**	Share of voice sessions that end in a successful submission
3	**Students come back to voice**	Share of first-time Academic Voice users who use voice again within 7 days

Targets to be set after a baseline measurement.

NON-GOALS

- Retraining the model for accents
- Offline voice processing
- Gamification or rewards
- A voice-only ChatGPT redesign
- An enterprise-focused solution

The problem is real

VALIDATION

62% have tried voice

~8% use it regularly

54% say typing feels easier

- Students find it hard to structure thoughts while speaking
- Voice feels rushed and unsuitable for complex questions
- ChatGPT is a creation tool (essays, explanations, code), so students need drafting control

The conversational voice model does not match academic workflows. That is a structural mismatch, not a comfort problem.

From the Milestone 02 student survey (small sample), so a direction rather than proof.

AUDIENCE

Indian college and university students, 18–24. High-frequency users, daily or several times a week. They use ChatGPT to study, solve doubts and prepare for exams.

Persona: Xyz, 20, engineering student

- Studies in a shared hostel
- Asks multi-step conceptual doubts
- Often edits a query before sending
- Needs structured, formatted answers

NEEDS

Pain points

- Cannot pause and rethink easily
- No control over how the answer is structured
- Voice feels like a live conversation, not drafting

Unmet needs

- Pause and resume thinking
- Edit the transcript before submitting
- Choose the answer format before generating
- A text-first response, for privacy

Speak first. Then decide.

THE IDEA

Instead of sending speech straight into a conversation, students draft by voice and control what happens next.

KEY FEATURES

- **Pause and resume.** Time to think and structure ideas without feeling rushed.
- **Visible recording timer.** Prevents unexpected cut-offs and builds confidence.
- **Structure My Doubt.** Choose how the answer is formatted: Explain, Step by step, Exam prep and more.
- **Text-first response.** Easy to read, copy and use, and more private in public.
- **Auto-saved draft.** Nothing is lost if the session is interrupted.

DECISIONS TAKEN

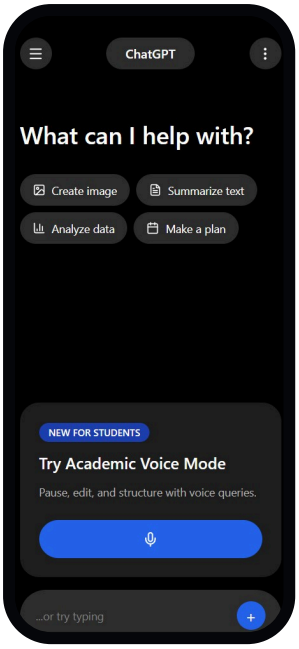

- Focus only on students, the largest segment
- Improve workflow control, not speech accuracy
- No gamification, to avoid distraction
- Text-first output, to reduce discomfort in public

OPEN ITEMS

- Set goal targets after a baseline measurement
- Check how the Structure step feels for longer, multi-part doubts

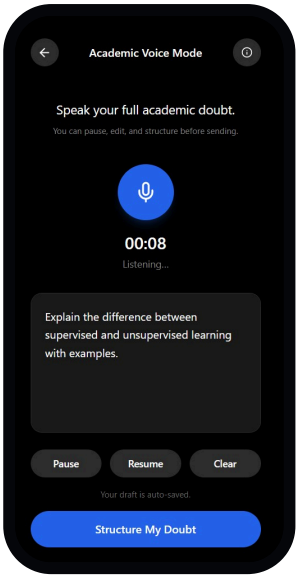

What the student sees

PROTOTYPE

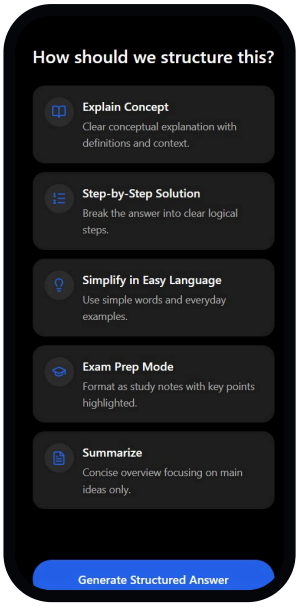

1 Discover

A New for students card on the home screen

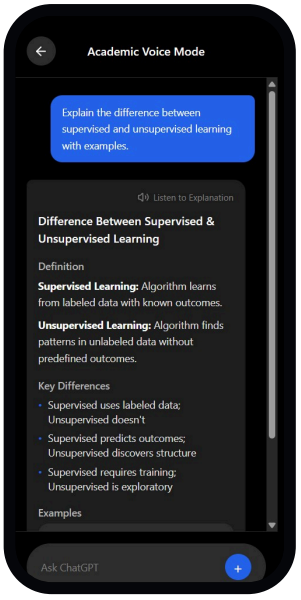

2 Speak

Timer, pause, resume, live transcript, auto-saved draft

3 Structure

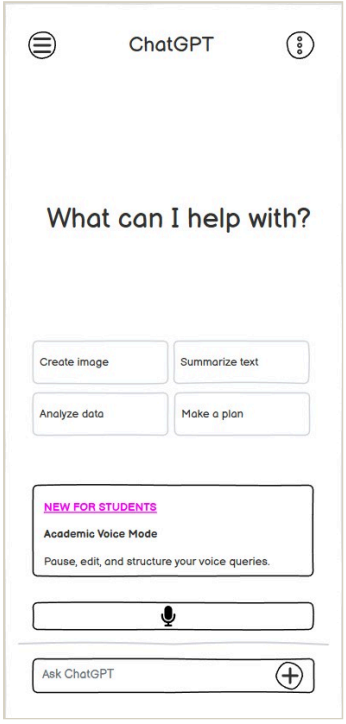

Pick Explain, Step by step, Simplify, Exam prep or Summarise

4 Read

A text-first answer that is easy to copy

WIREFRAME

The starting sketch: a New for students card sits above the text bar on the home screen and opens the voice drafting flow. The prototype screens above develop it. This is a concept design, not a ChatGPT release.
